

# Lecture 3: Observational Studies + Randomized Experiments + Confounding + Simpsons's Paradox

## Chapter 1.4

1 / 27

## Goals for Today

- ▶ We illustrate the difference between
  - ▶ an **observational study**
  - ▶ a **randomized experiment**, where the treatment is assigned at random.
- ▶ Introduce the notion of confounding AKA lurking variables
- ▶ Discuss **Simpson's Paradox** (not in textbook).

2 / 27

## Going Back to Previous Example

Going back to the study on

- ▶ The explanatory variable was: sleeping with your shoes on
- ▶ The response variable was: waking up with a headache
- ▶ The doctor hypothesized a **causal** relationship

## Confounding Variable AKA Lurking Variable

## Controlling for Potential Confounding

5 / 27

## Back to Shoes and Headaches

So imagine we recruit 10,000 people and randomly assign 5000 to:

- ▶ the treatment group: sleep with shoes
- ▶ the control group: sleep without shoes

i.e.

Group	$n$	# with headache
Treatment	5000	$n_1$
Control	5000	$n_2$

$n_1$  and  $n_2$  won't be very different i.e. no difference in headache level regardless of shoes.

6 / 27

## Observational Studies vs Randomized Experiments

7 / 27

## Observational Studies vs Randomized Experiments

The shoe/headache study introduced at the end of the last lecture is an **observational study**, so we cannot conclude that wearing shoes when you sleep causes you wake up with a headache.

8 / 27

## Maxim of Statistics

9 / 27

## Well-Known Example of Confounding

A famous example of an unaccounted for confounding variable is UC Berkeley admissions data. UCB was sued in 1973 for bias against women who had applied for admission to graduate schools.

Let's consider the  $n = 4526$  people who applied to the 6 largest departments.

10 / 27

Of the  $n = 4526$  applicants:

11 / 27

Split the counts by gender:

12 / 27

Look at proportions instead of counts:

13 / 27

What was the “competitiveness” of departments?

14 / 27

## Where were the women applying?

15 / 27

## So while in aggregate things looked like this:

16 / 27

## You need to account for department!

17 / 27

## Bickel et al.'s (1975) Explanation

There was a confounding variable: **competitiveness of department**, which is a function

- ▶ # of applicants
- ▶ # of available slots

Departments weren't discriminating against women per se, rather:

- ▶ women tended to apply to departments with high competition and hence lower admission rates, primarily the humanities.
- ▶ men tended to apply to departments with low competition and hence higher admission rates, primarily the sciences.

18 / 27

## Bickel et al.'s (1975) Explanation

In fact, Bickel et al. found that "If the data are properly pooled...there is a small but statistically significant bias in favor of women."

This was the exact opposite claim of the lawsuit. This is known as [Simpson's Paradox](#).

## Simpson's Paradox

## A Graphical Illustration of Simpson's Paradox

Say we have the following points:

21 / 27

## A Graphical Illustration of Simpson's Paradox

Overall, the best fitting single line suggests x is **negatively** related with y:

22 / 27

## A Graphical Illustration of Simpson's Paradox

But say we have the **confounding** variable color and fit two separate lines for each group:

23 / 27

## A Graphical Illustration of Simpson's Paradox

The subgroups now exhibit a **positive** relationship!

24 / 27

## A Graphical Illustration of Simpson's Paradox

i.e. the trend in aggregate is the **reverse** of the trend in the subgroups (teal & purple).

25 / 27

## Bickel et al.'s (1975) Conclusion

"The bias in the aggregated data stems not from any pattern of discrimination on the part of admissions committees, which seem quite fair on the whole, but apparently from prior screening at earlier levels of the educational system."

"Women are shunted by their socialization and education toward fields of graduate study that are generally more crowded, less productive of completed degrees, and less well funded, and that frequently offer poorer professional employment prospects."

The original paper can be found [here](#).

26 / 27

## Next time

We will discuss

- ▶ Specific types of sampling beyond just **simple random sampling**, as this is not always feasible
- ▶ Experimental design: some key principles to keep in mind when evaluating the efficacy of treatments.
