

# Lecture 8: Normal Distribution

## Chapter 3.1

# Goals for Today

- ▶ Define the normal distribution in terms of its parameters
- ▶ Review:  $\frac{2}{3}$  / 95% / 99.7% rule
- ▶ Standardizing normal observations to z-scores

# Normal Distribution

# Normal Distribution

# Normal Distribution

$\mu$  (mean) specifies the center,  $\sigma$  (standard deviation) the spread.

## Normal Example

$\mu$  (mean) specifies the center,  $\sigma$  (standard deviation) the spread.

## Normal Example

$\mu$  (mean) specifies the center,  $\sigma$  (standard deviation) the spread.

# Standardized Normal Distribution

If  $\mu = 0$  and  $\sigma = 1$ , this is the **standard normal distribution**:

# Rules of Thumb

Recall if a distribution is normal, then:

1. Approx.  $\frac{2}{3}$ 's of the data are within  $\pm 1$  SD of the mean
2. Approx. 95% of the data are within  $\pm 2$  SD of the mean

# Rules of Thumb

Recall if a distribution is normal, then:

1. Approx.  $\frac{2}{3}$ 's of the data are within  $\pm 1$  SD of the mean
2. Approx. 95% of the data are within  $\pm 2$  SD of the mean
3. Also approx. 99.7% of the data are within  $\pm 3$  SD of the mean

Ex: Standard Normal  $\mu = 0, \sigma = 1$

**Cyan Area is Two-Thirds**

Ex: Standard Normal  $\mu = 0, \sigma = 1$

**Cyan Area is 95%**

Ex: Standard Normal  $\mu = 0, \sigma = 1$

**Cyan Area is 99.7%**

## Motivating Example

From text: Say Ann scores 1800 on the SAT and Tom scores 24 on the ACT.

## Motivating Example

From text: Say Ann scores 1800 on the SAT and Tom scores 24 on the ACT. Say both tests scores were normally distributed with:

	SAT	ACT
Mean $\mu$	1500	21
SD $\sigma$	300	5

**Question:** Who did relatively better?

## z-scores

## z-scores

Back to Example

# Percentiles

Recall a **percentile** (%'ile) indicates the value below which a given %'age of observations fall below.

**Question:** What %'ile is Ann's SAT score of 1800?  
i.e. what is the blue shaded area?

# Percentiles

Because the total area under the curve is 1, the area to the left of  $z$  represents the %'ile of the observation:

# Percentiles

Because the total area under the curve is 1, the area to the left of  $z$  represents the %'ile of the observation:

- ▶ The blue shaded area on the left plot will be less than 0.5. We have %'iles less than the 50th %'ile.

# Percentiles

Because the total area under the curve is 1, the area to the left of  $z$  represents the %'ile of the observation:

- ▶ The blue shaded area on the left plot will be less than 0.5. We have %'iles less than the 50th %'ile.
- ▶ The blue shaded area on the right plot will be greater than 0.5. We have %'iles greater than the 50th %'ile.

# Normal Probability Table

A normal probability table allows you to:

- ▶ identify the %'ile corresponding to a z-score
- ▶ or vice versa: the z-score corresponding to a %'ile

# Normal Probability Table

A normal probability table allows you to:

- ▶ identify the %'ile corresponding to a z-score
- ▶ or vice versa: the z-score corresponding to a %'ile

The normal probability tables on page 409 represent z-scores and %'iles corresponding to area to the left:

# Normal Probability Table

$Z$	Second decimal place of $Z$									
	0.00	0.01	0.02	0.03	0.04	0.05	0.06	0.07	0.08	0.09

Back to Ann and Tom

# Next Time

Next time we will:

- ▶ Re-iterate the motivation for the normal curve.
- ▶ Go over examples using z-scores.
- ▶ Evaluating the normal approximation.
